# The Decimal System

- The number  $(256)_{10}$  means

2 1 0

- $(256)_{10} = 2 \times 10^2 + 5 \times 10^1 + 6 \times 10^0$

- Similarly

2 1 0 -1 -2

$$789.51 = 7 \times 10^2 + 8 \times 10^1 + 9 \times 10^0 + 5 \times 10^{-1} + 1 \times 10^{-2}$$

# Binary

- The Binary system comprises only two numbers – 0 and 1.
- Numbers could be – 00, 01, 10, 11 (meaning 0,1,2,3 in decimal)
- Thus,

$$(0101)_2 = 0 \times 2^3 + 1 \times 2^2 + 0 \times 2^1 + 1 \times 2^0$$

**Similarly,**

$$(110.01)_2 = 1 \times 2^2 + 1 \times 2^1 + 0 \times 2^0 + 0 \times 2^{-1} + 1 \times 2^{-2}$$

# The Bit

- **Bit**: Binary Digit
- 4 bits make a Nibble and 8 bits make a Byte
- Using 2 bits we can generate 4 combinations viz. 00, 01, 10, 11 standing for 0, 1, 2 and 3 in the decimal system
- Thus, using  $n$  bits we can generate  $2^n$  combinations

# LOGIC GATES

- A **logic gate** is an electronic component whose output is computed based on a function of the inputs.
- A gate can have one or more inputs.
- Inputs may be given directly as **0** (LOW VOLTAGE\*) or **1** (HIGH VOLTAGE\*) or they could be derived from the output of other logic gates.
- \* LOW generally means 0V and HIGH generally means 3V or 5V.
- Computers use a very large number of such interconnected gates.

# LOGIC GATES: *AND*

- In order for current to flow, both switches must be closed
  - Logic notation  $A \bullet B = C$

A	B	C
0	0	0
0	1	0
1	0	0
1	1	1

# LOGIC GATES: *OR*

- Current flows if either switch is closed
  - Logic notation  $A + B = C$

A	B	C
0	0	0
0	1	1
1	0	1
1	1	1

# GATES: Inversion (NOT)

Logic:  $Q = A'$

A	Q
0	1
1	0

Q is said to be the complement of A and is denoted as either  $\overline{A}$  or  $A'$

# GATES: Exclusive OR (XOR)

A	B	S
0	0	0
1	0	1
0	1	1
1	1	0
