The Matrix Eigenvalue Problem

The Matrix Eigenvalue Problem

Let $A \in \mathbb{C}^{n \times n}$. The eigenvalue problem for A consists of finding all $x \in \mathbb{C}^n \setminus \{0\}$ and $\lambda \in \mathbb{C}$ such that

$$Ax = \lambda x.$$

The scalars $\lambda \in \mathbb{C}$ are called the eigenvalues of A and the corresponding non zero vector x is called an eigenvector of A.

- The eigenvalues of A are the roots of $\det(A - sI)$.
- $A \in \mathbb{C}^{n \times n}$ can have at most n distinct eigenvalues.
- Any set of eigenvectors of A corresponding to distinct eigenvalues is a linearly independent set.
- Matrices A and B are said to be similar if there exists a nonsingular matrix S such that $B = S^{-1}AS$. If S is a unitary matrix, then A and B are said to be unitarily similar.
- Similar matrices have the same eigenvalues.

The Matrix Eigenvalue Problem

- If $Av = \lambda v$ for some $v \neq 0$, and $B = S^{-1}AS$, then $BS^{-1}v = \lambda S^{-1}v$.
- A matrix A is said to be (unitarily) diagonalizable is it is (unitarily) similar to a diagonal matrix.
- (Unitary) diagonalizability of an $n \times n$ matrix A is equivalent to the existence of a (orthonormal) basis of $\mathbb{C}^n$ consisting of eigenvectors of A.
- Not every matrix is diagonalizable.
- Given any matrix $A \in \mathbb{C}^{n\times n}$, there exists an invertible matrix X and a block diagonal matrix $J = \mathrm{diag}(J_{\lambda_1}, \ldots, J_{\lambda_n})$, with

$$J_{\lambda_i} = \begin{bmatrix} \lambda_i & 1 & & & \\ & \lambda_i & 1 & & \\ & & \ddots & \ddots & \\ & & & \lambda_i & 1 \\ & & & & \lambda_i \end{bmatrix}, \quad i = 1, \ldots, p,$$

such that $A = XJX^{-1}$. J is the called the *Jordan Canonical form of* A.

Schur's Theorem

Issai Schur
(1875-1941)

Schur's Theorem

Issai Schur
(1875-1941)

Schur's Theorem: Given any matrix $A \in \mathbb{C}^{n \times n}$, there exists a unitary matrix Q and an upper triangular matrix T such that $Q^* A Q = T$.
T is called a Schur form of A.

Spectral Theorems

Spectral Theorem for Hermitian Matrices $A \in \mathbb{C}^{n \times n}$ is Hermitian if and only if there exists a unitary matrix Q and a real diagonal matrix D such that $Q^* A Q = D$.

Spectral Theorems

Spectral Theorem for Hermitian Matrices $A \in \mathbb{C}^{n \times n}$ is Hermitian if and only if there exists a unitary matrix Q and a real diagonal matrix D such that $Q^* A Q = D$.

Spectral Theorem for Normal Matrices $A \in \mathbb{C}^{n \times n}$ is normal if and only if there exists a unitary matrix Q and a diagonal matrix D such that $Q^* A Q = D$.

Spectral Theorems

Spectral Theorem for Hermitian Matrices $A \in \mathbb{C}^{n \times n}$ is Hermitian if and only if there exists a unitary matrix Q and a real diagonal matrix D such that $Q^* A Q = D$.

Spectral Theorem for Normal Matrices $A \in \mathbb{C}^{n \times n}$ is normal if and only if there exists a unitary matrix Q and a diagonal matrix D such that $Q^* A Q = D$.

Spectral Theorem for Symmetric Matrices $A \in \mathbb{R}^{n \times n}$ is symmetric if and only if there exists a real orthogonal matrix Q and a real diagonal matrix D such that $Q^T A Q = D$.

Spectral Theorems

Spectral Theorem for Hermitian Matrices $A \in \mathbb{C}^{n \times n}$ is Hermitian if and only if there exists a unitary matrix Q and a real diagonal matrix D such that $Q^* AQ = D$.

Spectral Theorem for Normal Matrices $A \in \mathbb{C}^{n \times n}$ is normal if and only if there exists a unitary matrix Q and a diagonal matrix D such that $Q^* AQ = D$.

Spectral Theorem for Symmetric Matrices $A \in \mathbb{R}^{n \times n}$ is symmetric if and only if there exists a real orthogonal matrix Q and a real diagonal matrix D such that $Q^T AQ = D$.

Real Schur's Theorem [Wintner-Murnaghan] Given any $A \in \mathbb{R}^{n \times n}$. there exists a real orthogonal matrix Q and a quasi-upper triangular matrix T such that $Q^T AQ = U$.

Spectral Theorems

Spectral Theorem for Hermitian Matrices $A \in \mathbb{C}^{n\times n}$ is Hermitian if and only if there exists a unitary matrix Q and a real diagonal matrix D such that $Q^*AQ = D$.

Spectral Theorem for Normal Matrices $A \in \mathbb{C}^{n\times n}$ is normal if and only if there exists a unitary matrix Q and a diagonal matrix D such that $Q^*AQ = D$.

Spectral Theorem for Symmetric Matrices $A \in \mathbb{R}^{n\times n}$ is symmetric if and only if there exists a real orthogonal matrix Q and a real diagonal matrix D such that $Q^TAQ = D$.

Real Schur's Theorem [Wintner-Murnaghan] Given any $A \in \mathbb{R}^{n\times n}$. there exists a real orthogonal matrix Q and a quasi-upper triangular matrix T such that $Q^TAQ = U$.
